Information Assurance for Network-Centric Naval Forces
National Research Council 2010-04-11 Owing to the expansion of network-centric operating concepts across the Department of Defense (DOD) and the growing threat to information and cybersecurity from lone actors, groups of like-minded actors, nation-states, and malicious insiders, information assurance is an area of significant and growing importance and concern. Because of the forward positioning of both the Navy's afloat and the Marine Corps expeditionary forces, IA issues for naval forces are exacerbated, and are tightly linked to operational success. Broad-based IA success is viewed by the NRC's Committee on Information Assurance for Network-Centric Naval Forces as providing a central underpinning to the DOD's network-centric operational concept and the Department of the Navy's (DON's) FORCENet operational vision. Accordingly, this report provides a view and analysis of information assurance in the context of naval 'mission assurance'.

Quality Control and Assurance Leo Kounis 2017-02-22
Quality control and assurance cover a diverse area of modern life and play, undeniably, an important role. This book brings together a collection of international papers that showcase examples of current research and practice in industry and the medical profession. It is hoped that engineers, researchers and scientists will be assisted in their continuous quest for excelling in qualitative aspects. The Ancient Greek word arete means excellence or virtue and defines the highest qualitative state: a mans effectiveness and skill in goodness (optimum potentiae). Indeed, Ancient Greeks believed that without quality control, specifications are useless and may result to illegitimacy, which in turn may become a threat to society itself.

Model-Driven Development of Reliable Automotive Services Manfred Broy 2008-07-17 Software development for the automotive domain has become the enabling technology for almost all safety-critical and comfort functions offered to the customer. Ninety percent of all innovations in automotive systems are directly or indirectly enabled by embedded software. The numbers of serious accidents have declined in recent years, despite constantly increasing traffic; this is correlated with the introduction of advanced, software-enabled functionality for driver assistance, such as electronic stability control. Software contributes significantly to the automotive value chain. By 2010 it is estimated that software will make up 40% of the value creation of automotive electronics. However, with the large number of software-enabled functions, their interactions, and the corresponding networking and operating infrastructure, come significant complexities both during the automotive systems engineering process and at runtime. A central challenge for automotive systems development is the scattering of functionality across multiple subsystems, such as electronic control units (ECUs) and the associated networks. As an example, consider the central locking systems (CLS), whose functionality is spread out over up to 19 different ECUs in some luxury cars. Of course, this includes advanced functionality, such as seat positioning and radio tuning according to driver presets upon entry, as well as unlocking in case of a detected impact or accident. However, this example demonstrates that modern automotive systems bridge comfort- and safety-critical functionality. This induces particular demands on safety and security, and, in general, software and systems quality. The resulting challenges and opportunities were discussed, in depth, at the second Automotive Software Workshop San Diego

(ASWSD) 2006, on whose results we report here. *ACCT4 Management 4e* Prabhu Sivabalan 2021-10-01 The highly visual and engaging fourth edition of ACCT Management offers an innovative approach to teaching and learning management accounting.
